

Testimonials and Comments

Testimonials from Actual Prototype Users

"As you know, I was having trouble "seating" the device into my ear. I'm very satisfied with the Gruv Button. I could have saved a lot of irritation if I had found it earlier." Ray in Wisconsin

"I wasn't wearing my hearing aids because I had trouble inserting them with the arthritis in my hands and was concerned about losing one or both of them. Now I can get them in my canals really, really deeply where they should be. And once they are in they stay put, even when I wear my hat. Gruv Buttons are just a part of me now." Lucy in Wisconsin

"Those are the best things that ever happened. They are so much easier to get in now and they do the job." Jerry in Wisconsin

Comments from Other Hearing Aid Users

"I think it's a great idea for older people like me. This should have been done years ago. I have a lot of trouble getting them in my ears. Very irritating!" Edward in Wisconsin

"This would make it easier for my mother. I'm tired of seeing her frustrated!" Kristine in Wisconsin

"Due to a lack of sensation in my left hand, this would be a great tool to get my left speaker into my left ear with little problem at all." James in Wisconsin

"We do struggle to get those hearing aids in. I have an ear canal that's narrow and that is a problem." Joanne in Wisconsin

"It would be nice for people with Parkinson's like me to have this push point to control and steer the speaker. I can't get to the round end of the speaker but with this thing, I could feel which direction to go. When you have Parkinson's, you don't have the feeling in your hand that you used to." David in Wisconsin

"This addresses two problems that I have had with my hearing aids. Twice I have lost one of my hearing aids on the golf course, presumably when I have taken off my cap. And I have been constantly pushing them in harder to the point where my ear hurts. I will truly benefit from this. I am writing my congressmen to encourage their support." Chuck in Wisconsin

"I have to monkey around to get my right hearing aid in. It is a pain in the neck! This would be fantastic!" Dolores in Wisconsin

"I have to get it angled just right then I have to take 2 fingers to get it in there. Anything to make it easier to get in would be nice. When I started I had a hell of a time! This would help me control it." George in Wisconsin

"This is definitely a good invention, especially for us older veterans!" Michael in Wisconsin

"Unless you get to this age yourself, you can't understand it. Getting them in is half the battle. I think this idea is wonderful!" Margaret in Wisconsin

"I am a decorated combat veteran and this technology would be wonderful! I have trouble putting them in. It would be easier for older people, like me, to get their hearing aids in." James in Wisconsin

"I just want to say to the young engineers, your day is coming. It's not easy being older and to have limitations due to age. Enjoy your young age while you can. Your days are coming." Laurene in Wisconsin

Comments from Caregivers

"As a nurse, I can tell you, it's not easy to put hearing aids in other people's ears. This will help caregivers!" Suzanne in Wisconsin

"My wife has arthritis in her hands and I can see how this would be helpful for those people with arthritis because there would be something for them to grab." Jerry in Wisconsin

"As a nurse, I know all about challenging ear canals! I know that it would probably help me, too. I think that's pretty cool!" Sharon in Wisconsin

"When they design these things, they don't have an elderly person directing them so they don't know what it's like for elderly people wearing hearing aids. They should have older people who use hearing aids on their board and get input from these people." Michael in Wisconsin

Comments from Hearing Care Professionals

"As an Audiologist and a hearing aid user I could not agree more." Deepak in India.

"WE NEED THIS THING!" Jim in Wisconsin

"I've seen plenty of patients give up on their hearing aids simply because they're dependent on others just to put them on! The Gruv button would be an absolute game changer. Hope to see it implemented in receivers globally." Aaron in Singapore

"As an audiologist, I want to support your work with Gruv Button Technology because I know it will make it so much easier for people to insert their receivers into their auditory canals. And, this is important!" Elif in Türkiye

"Research indicates that people who wear their hearing aids more hours per day tend to experience optimal quality of life benefits from their devices. The ability to wear devices starts with easy and proper insertion into the ear each day." Brian in Minnesota

"Great idea. Patients struggle with insertion on a daily basis." David in Wisconsin
